[3.3.1] What is the fundamental frequency  $\omega_0$  of a periodic signal if its fundamental period is  $T$ ?

- A.  $\omega_0 = T/2\pi$
- B.  $\omega_0 = 2\pi/T$
- C.  $\omega_0 = \pi T$
- D.  $\omega_0 = 1/T$

[3.3.4] In the Fourier series representation  $x(t) = \sum_{k=-\infty}^{+\infty} a_k e^{jk\omega_0 t}$ , what are the terms for  $k = +1$  and  $k = -1$  collectively referred to as?

- A. DC component
- B. Second harmonic components
- C. Fundamental components
- D. Nyquist components

[3.3.7] What is the name given to the equation  $x(t) = \sum_{k=-\infty}^{+\infty} a_k e^{jk\omega_0 t}$ , which reconstructs a signal from its Fourier series coefficients?

- A. Analysis equation
- B. Synthesis equation
- C. Convolution equation
- D. Transform equation

[3.3.10] For the signal  $x(t) = \sin \omega_0 t$ , what is the Fourier series coefficient  $a_1$ ?

- A.  $1/2$
- B.  $-1/2j$
- C.  $1/2j$
- D.  $0$

[3.6.1] What is a key difference between the Fourier series representation of discrete-time periodic signals and continuous-time periodic signals?

- A. Discrete-time is an infinite series, continuous-time is a finite series.
- B. Discrete-time is a finite series, continuous-time is an infinite series.
- C. Both are always infinite series.
- D. Both are always finite series.

[3.4.3] What phenomenon describes the ripples and overshoot observed near discontinuities when a discontinuous signal is approximated by a truncated Fourier series?

A. The Doppler Effect

B. The Heisenberg Uncertainty Principle

C. The Gibbs Phenomenon

D. The Superposition Principle

[3.6.4] What is the primary purpose of the discrete-time Fourier series analysis equation  $a_k = \frac{1}{N} \sum_{n=\langle N \rangle} x[n] e^{-jk(2\pi/N)n}$ ?

- A. To reconstruct the signal  $x[n]$  from its coefficients.
- B. To determine the Fourier series coefficients  $a_k$  from the signal  $x[n]$ .
- C. To calculate the total energy of the signal.
- D. To find the fundamental period  $N$ .

[2.4.2] Linear constant-coefficient difference equations are typically used to describe which type of systems?

- A. Continuous-time systems only.
- B. Nonlinear systems.
- C. Discrete-time systems only.
- D. Analog systems.

[3.7.1] What is a common similarity between the properties of discrete-time Fourier series and continuous-time Fourier series?

- A. They are identical in all aspects.
- B. The multiplication of two signals in the time domain corresponds to a form of convolution in the frequency domain.
- C. Both always result in an infinite number of coefficients.
- D. There are no similarities.

[3.5.1] If  $x(t)$  has Fourier series coefficients  $a_k$  and  $y(t)$  has Fourier series coefficients  $b_k$ , what are the Fourier series coefficients for  $z(t) = Ax(t) + By(t)$ ?

- A.  $Ab_k + Ba_k$
- B.  $(A + B)(a_k + b_k)$
- C.  $Aa_k + Bb_k$
- D.  $a_k b_k$
